Recommended System Requirements

Operating System

PC-DMIS 2015.0 operates under the following:

- 32-bit and 64-bit Vista
- 32-bit and 64-bit Windows 7
- 32-bit and 64-bit Windows 8 and 8.1

No other operating systems are supported.

Windows XP support: Beginning with v2012 MR1, support will be phased out for the Windows XP operating system. While this version likely runs fine in XP, it will not be tested under the XP operating system. Also note that some parts of the user interface do not appear optimally in XP. Support will be completely dropped in 2016.

IMPORTANT: When using third-party drivers, you should contact your local Hexagon representative to ensure operating system compatibility.

IMPORTANT: Running PC-DMIS inside a Virtual Machine (VM) is not supported.

Notes:

- PC-DMIS Vision machines do not support 32-bit and 64-bit Windows 8.
- The Matrox Framegrabber PC-DMIS Vision hardware component does not support a 64-bit operating system.

Advantages of 64-bit:

- Customers with the x64-bit version of CAD packages need the 64-bit version of PC-DMIS in order to use Direct CAD Interfaces (DCI) to connect to the packages.
- The 64-bit version of PC-DMIS can use all of the physical memory that is available on the computer. The 32-bit version of PC-DMIS can only use the first 2 GB. Therefore, customers with large CAD or measurement routines are advised to use the x64-bit version.

.NET Framework

- Microsoft .NET 4.0 for Windows 7
- Microsoft .NET 4.5 for Windows 8

RAM

- 4 GB of RAM or higher (4 GB is the highest amount of memory capable on a 32-bit OS)

The size of the CAD data file and the tessellation multiplier value used affect the amount of memory needed. These both affect the amount of tessellated facets needed to display the model. The smaller the tessellation multiplier value used, the more memory needed for the facets. For large CAD models, this could cause an "Out Of Memory" error. If this occurs, the current PC-DMIS session will be left in an unstable state and should be terminated.

The default tessellation multiplier value is 1.0. Setting a tessellation multiplier of 0.1 will result in a 10 to 20 percent increase in the memory required over the default value of 1.0. Decreasing the tessellation multiplier further to 0.01 will result in an additional 50 to 65 percent increase of memory required.

- 1 GB of video RAM

CPU

2 GHZ or higher Duo-Core processor

Graphics

- For desktops: Nvidia Quadro K620 graphics card
- For laptops: Nvidia Quadro K1100M graphics card
- The graphics driver must support OpenGL 3.0 or higher. A warning message appears on PC-DMIS startup if the driver does not support OpenGL 3.0 or if your graphics driver is more than a year old.

Hard Drive

- 2 GB of free hard drive space plus allocated Virtual Memory of 8 times the largest CAD file used
- SSD drive, HDD 10K, or two disks in RAID 0 mode (high-performance hard disk drive)

Display

Screen resolution of 1280 x 1024 or higher

Connectivity

- 2 Ethernet ports. (This may be required for specific installations in consideration of local needs, including but not limited to CMM systems where one port is required for controller communications and another for intranet/Internet communications.)
- 2 USB ports
- DVD drive
- HASP key (a physical USB portlock) or a software license

Note: A HASP key does not act as general-purpose data storage; therefore, you cannot use a HASP key to store (download) arbitrary data from a computer. Similarly, you cannot use a HASP key to put (upload) arbitrary data on a computer. Also, only Hexagon Metrology applications can read or write to a HASP key; other applications do not have this capability. As a result, you cannot use a HASP key to load and unload data to and from a computer.

Browser

Internet Explorer version 9

Anti-Virus Software

The Sophos Anti-virus tool was used by Wilcox Associates Inc. while testing PC-DMIS. The performance of any other anti-virus tool will need to be confirmed by the user.

<http://sophos.com/products/enterprise/endpoint/security-and-control/>

Solutions for CMMs Using RS-232 Communications

If you are installing PC-DMIS on a new or existing computer, but you have an older CMM model that uses RS-232 communications, then you will need to install one of these solutions on your computer:

- An external RS-232 serial-to-USB adapter cable plus the serial-to-USB adapter cable driver
- An internal serial adapter card with serial ports

Installing PC-DMIS

To install the application, follow these steps:

Step 1: Check System and Hardware Requirements

Before you attempt to install a new PC-DMIS version, ensure that you meet the system and hardware requirements discussed above in "[Recommended System Requirements](#)". You must also have a USB portlock or a valid software license for the installation to work. Your IT specialist can help you with this information.

- To get your computer's properties, highlight the **My Computer** icon, right-click on it, and select **Properties**.
- To check the display properties for the graphics card, select **Start | Settings | Control Panel**, and then select **Display and Settings**.

Step 2: Log on as an Administrator

To install and run your new PC-DMIS version for the first time, you must be logged on as a user with administrator privileges.

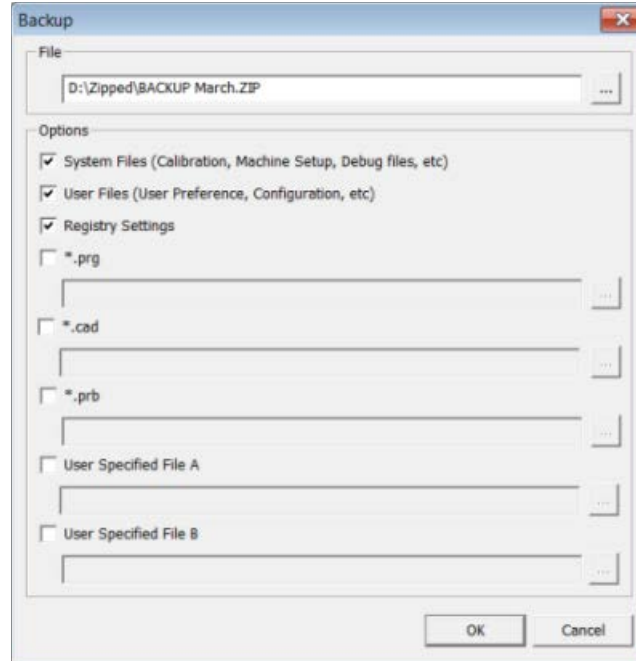

Step 3: Back Up Existing Settings

Back up your settings from your previous version. By default, PC-DMIS attempts to migrate existing settings from previous installs on the same computer, even from really old versions of PC-DMIS where settings were stored in the pcdlrm.ini file.

- If your current version uses the pcdlrm.ini file for its settings, back up your pcdlrm.ini file. This file is found in the Windows system directory. Save a copy of the file in a safe place.
- If your current version uses the PC-DMIS Settings Editor, back up your PC-DMIS Settings Editor data.

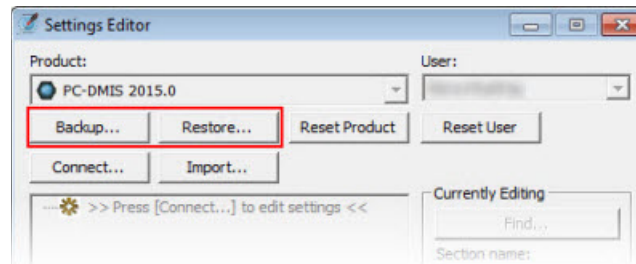

To do this:

1. Start the Settings Editor.
2. Click the **Backup** button (or **Export**). The **Backup** dialog box appears:

3. In the **File** box, define a safe location to save the backed up files, and give the file a .zip extension.
4. Mark the first three check boxes, and click **OK**.

If you are replacing your computer or transferring settings that reside on another computer, you can use the Settings Editor's **Backup** and **Restore** buttons:

For more information on the backup and restore functionality, refer to the Settings Editor documentation.

Backing Up Machine Files for an Xcel CMM or a Sharpe Controller

If you are using a Brown and Sharpe Xcel CMM or a CMM that uses a Sharpe controller, and you are going to install PC-DMIS 2015.0 on a new computer, save copies of the following CMM machine files from your previous version to a safe place:

- comp.dat
- downl.oad

The files are located in the PC-DMIS installation (root) directory for all versions of PC-DMIS prior to 2013 MR1, regardless of the operating system.

The location of the PC-DMIS installation (root) directory depends on the operating system and version of PC-DMIS:

- **C:\Program Files (x86)\WAI\PC-DMIS <version>** (if you have a 32-bit version)
- **C:\Program Files\WAI\PC-DMIS <version>** (if you have a 64-bit version)

Where <version> is the PC-DMIS version.

For versions of PC-DMIS up to and including 3.7 MR3, the location of the installation (root) directory is:

C:\PCDMISW

Starting with PC-DMIS 2013 MR1, the comp.dat file moved to:

C:\ProgramData\WAI\PC-DMIS\<version>

Backing Up Machine Files for a CMM with a DEA Controller

If you are using a DEA or other CMM with a DEA machine controller, and you are going to install PC-DMIS 2015.0 on a new computer, save copies of the following CMM machine files from your previous version to a safe place (the files vary according to the type of CMM):

- cosdat1.bin
- compens.dat
- Fzyfile.txt
- Rcxfile.txt
- Rmxfile.txt
- Any file with your machine's serial number in its name

The files are located in the PC-DMIS installation (root) directory for all versions of PC-DMIS prior to PC-DMIS 2013 MR1, regardless of the operating system.

The location of the PC-DMIS installation (root) directory depends on the operating system and version of PC-DMIS:

- **C:\Program Files (x86)\WAI\PC-DMIS <version>** (if you have a 32-bit version)
- **C:\Program Files\WAI\PC-DMIS <version>** (if you have a 64-bit version)

Where <version> is the PC-DMIS version.

For versions of PC-DMIS up to and including 3.7 MR3, the location of the installation (root) directory is:

C:\PCDMISW

Starting with PC-DMIS 2013 MR1, the compens.dat file moved to:

C:\ProgramData\WAI\PC-DMIS\<version>

Step 4: Install PC-DMIS

The following steps run you through a typical installation. Your installation screens may differ if you are running a different version of PC-DMIS. In addition, your PC-DMIS license may be configured with different options.

1. Locate the PC-DMIS install file on your installation media; or, if you downloaded it, open the directory containing the downloaded file. The install file looks like this:

Pcdmis2015.0_Release_#.###.#_x##.exe

Where the # symbols represent the specific version numbers and the version type (x64 or x86).

2. Double-click this executable to begin the installation process. If a security warning appears, click **Run**. The files are extracted to a temporary directory:

The **Choose License Type** screen appears:

3. Select one of the following license types:
 - **HASP** - If you have a physical USB portlock, ensure that it is connected to your computer, and then select this license type. It is selected by default.
 - **LMS (Software) License** - If you have been issued a software license (called an Entitlement ID), or if you are connecting to a local license server, select this license type.

Click **Next**.

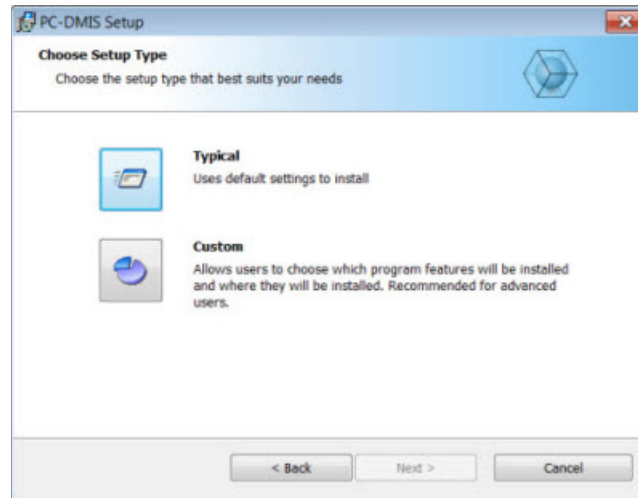

4. If you chose **HASP**, ignore this step, and proceed to step 5. If you chose **LMS (Software) License**, and it cannot find a valid license on your system, the **LMS License Setup** screen appears. For help with completing this screen, see "[LMS License Setup](#)".
5. The main setup screen then appears:

Click **Next**. The license agreement appears:

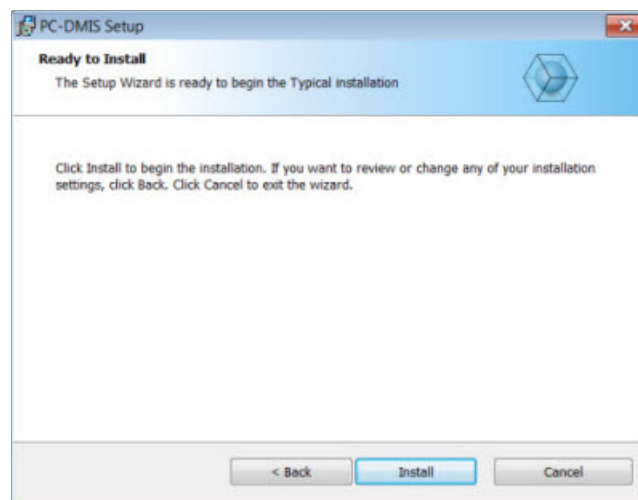

6. Read and accept the license agreement, and then click **Next**. The **Choose Setup Type** screen appears:

7. Choose a setup type:

- **Typical** - This option installs the program files to the default installation location: **C:\Program Files\WA\PC-DMIS 2015.0**
- **Custom** - Use this option to specify the components to install and customize the installation location. The **Custom Setup** screen appears. For help with completing this screen, see "[Custom Setup](#)".

8. Once the installation has all the information it needs, the **Ready to Install** screen appears:

9. Click **Install**. When the installation finishes, this final screen appears:

- **Launch PC-DMIS after the install finishes.** - To launch the application once you click **Finish**, select this check box. You should do this so that the needed registry entries are initialized. For more information, see "[Administrator Privileges Explained](#)".
- **Display Release Notes.** - To display a PDF file that shows what is new or has changed in this release once you click **Finish**, select this check box.

10. Click **Finish** to close the installation program. PC-DMIS is now installed.

LMS License Setup

If you chose **LMS (Software) License** on the [Choose License Type screen](#), and a valid license cannot be found on your system, you need to fill out the **LMS License Setup** dialog box:

1. Fill out the **LMS License Setup** screen as needed:

- **Use Entitlement ID** - If you have an Entitlement ID, select this item, and then type or paste the ID you were issued in the box.
- **URL to FNO Services** - This points to the URL that verifies your license. Ensure that it has this URL:

<https://licensing.wilcoxassoc.com/flexnet/services>

- **Proxy Information** - You only need to fill this out if you are on a network where a proxy server is needed to reach the Internet. Contact your IT specialist to get this information, and then fill in the server host, user name, and password.
- **Use License Server(s)** - If you are using a local license server, select this item, and then type your license server name. The format of this line of text should be <portnumber>@<servername>, where <portnumber> is the TCP port number for the license server and <servername> is the name of the server. The default TCP port number is 27000, and is used automatically if no specific port number is identified. For example, these mean the same thing:

@server1

27000@server1

Important: When using this option, make sure the "@" symbol is used in front of the server address. If the "@" symbol is left off, the install attempts to look locally for the license which may result in an error.

You can also specify multiple license servers. These are separated by semicolons. For example, suppose that you have three license servers called licenseserver1, licenseserver2, and licenseserver3, all using the default TCP port. You can specify all of them in a single line of text, like this:

```
@licenseserver1;@licenseserver2;@licenseserver3
```

2. If you do not have an Entitlement ID and need to activate your license offline, click the **CLM Admin** button and follow the instructions.

Note: Please consult the [PC-DMIS CLM Licensing Software documentation \(pcdmiscdm.chm\)](#) located in the PC-DMIS language subdirectory.

3. Click **Next** to proceed. The install software connects to the Internet and activates your license. It then installs the FLEXnet Licensing Service required to use LMS licenses.

Providing LMS Licensing Information to the Installer from the Command Line

You can send LMS licensing information to the installer through command line parameters. For more information, see "[Providing LMS Licensing Information to the Installer from the Command Line](#)" in Appendix A.

LMS License Update

Once the licensing is completed and PC-DMIS is installed, PC-DMIS checks for license updates on startup and every eight hours of running. If a license update is available, a notification message appears:

PC-DMIS
Updates are available for your PC-DMIS license. Applying them now will require PC-DMIS to restart. Would you like to apply the updates now?

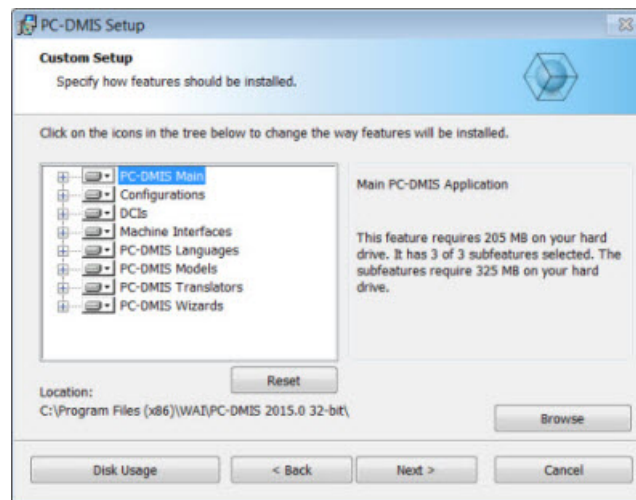

Click **Yes** to apply the update. If you click **No**, PC-DMIS displays the message every eight hours of running or on the next startup.

- If an option or feature is added, you are given the choice to apply the changes. A pop-up message displays in the system tray if you apply the changes.
- If an option or feature is removed, a message requesting you to restart PC-DMIS is displayed. A pop-up message also displays in the system tray to inform you of this.
- If an option or feature is obsolete, it is automatically removed.

Note: To ensure that PC-DMIS functions properly, you must restart PC-DMIS after any update is applied.

Custom Setup

If you chose **Custom** on the [Choose Setup Type screen](#), a screen similar to the following appears:

Customizing Installed Features

By default, all program components are selected to be included in the installation. You can use the tree view to customize when or if these features are installed. To do this:

1. Click the small drop-down icon  next to the component to exclude. This list appears:

2. Choose the desired option:
 - **Will be installed on local hard drive** - The selected feature is installed to the hard drive on your computer.
 - **Entire feature will be installed on local hard drive** - The entire feature is installed to the hard drive on your computer. This means that sub-features of the selected feature are also installed.
 - **Will be installed to run from network** - *This option is currently unsupported.* This option installs the selected feature on a network share.
 - **Entire feature will be installed to run from network** - *This option is currently unsupported.* This option installs the entire component to a network share. This means that sub-features of the selected feature are also installed.

- **Feature will be installed when required** - The feature is only installed if required during the installation process. Some files are informational and are not required for the application to run. These may include documentation or other files.
- **Entire feature will be unavailable** - This option excludes the component from installation.

Customizing the Installation Location

By default, the program installs to this location under the "PC-DMIS 2015.0" directory:

- **C:\Program Files (x86)\WAI** (if you have a 32-bit version)
- **C:\Program Files\WAI** (if you have a 64-bit version)

To change the default location:

1. Click the **Browse** button and navigate to the directory on your computer that you want to hold the program files. When you click **OK**, the **Location** box changes to show the selected location.

If you want to reset the items to the default selection, click **Reset**.

2. Click **Next** when you have finished customizing the install.

Administrator Privileges Explained

PC-DMIS versions earlier than version 2012 require that you run PC-DMIS as an administrator because some system settings (such as the last probe used, wrist angles, and other items) were shared among all users on that computer. This required that these settings were placed in the LOCAL_MACHINE section of the Windows registry instead of in the CURRENT_USER section (for user-specific settings). Making changes to settings in the LOCAL_MACHINE section requires administrator privileges.

In PC-DMIS version 2012 and later, the settings mechanism used by PC-DMIS changed to only require administrator access the very first time it runs at the end of the installation. From that point forward, standard user access is sufficient.

The PC-DMIS installer has a flag built into the setup executable (setup.exe) that requires the setup process to run with administrator privileges. If the current user has lesser privileges, the setup displays a prompt to provide a user name and password of an account with administrator privileges.

Once the installation finishes, the first time you run PC-DMIS, you must launch it with administrator privileges. If you mark the [Launch PC-DMIS after the install finishes check box](#) when installation finishes, PC-DMIS does this automatically by passing the original privilege level of the installer onto PC-DMIS.

Note, however, that if you do not mark this check box, you will need to explicitly right-click on the shortcut and select **Run as administrator** as described in [Step 6](#).

For more information on the file system and registry rights that PC-DMIS requires, see "[Required User Access Rights](#)" in Appendix B.

Step 5: Copy Files after Installation

If these files are available, copy them from your old PC-DMIS installation directory to the directory where you installed the newer version:

- Sysparam.dat
- Downl.oad
- Fzyfile.txt
- Rcxfile.txt
- Rmxfile.txt

Starting with PC-DMIS 2010 MR2, PC-DMIS automatically copies common system files to the program data files directory when you install a newer version of PC-DMIS.

The comp.dat, compgrid.at, comp.enc, and compens.dat volcomp files used with volcomp methods 13 (ASI) and 14 (BNS) must be in the program data files directory. When a newer version of PC-DMIS is installed, these files are automatically copied to the program data files directory for the new version. For the default path location of this directory, see "[Understanding File Locations](#)" in Appendix B.

For additional information on volumetric compensation files and setup, see the Machine Interface Installation Manual (MIIM).

Copying Machine Files for an Xcel CMM or a Sharpe Controller

If you are using a Brown and Sharpe Xcel CMM or a CMM that uses a Sharpe controller, and you installed PC-DMIS 2015.0 on a new computer, copy the backed-up CMM machine files to the following location on the new computer:

- **C:\Program Files (x86)\WAI\PC-DMIS <version>** (if you have a 32-bit version)
- **C:\Program Files\WAI\PC-DMIS <version>** (if you have a 64-bit version)

Where <version> is the PC-DMIS version.

For more information about these files, see “[Backing Up Machine Files for an Xcel CMM or a Sharpe Controller](#)”.

Copying Machine Files for a DEA CMM with a DEA Controller

If you are using a DEA CMM with a DEA machine controller, and you installed PC-DMIS 2015.0 on a new computer, copy the backed-up CMM machine files to the following location on the new computer:

- **C:\Program Files (x86)\WAI\PC-DMIS <version>** (if you have a 32-bit version)
- **C:\Program Files\WAI\PC-DMIS <version>** (if you have a 64-bit version)

Where <version> is the PC-DMIS version.

For more information about these files, see “[Backing Up Machine Files for a DEA CMM with a DEA Controller](#)”.

Step 6: Launch PC-DMIS for the First Time

1. When running this version of PC-DMIS for the first time, choose **Start, All Programs, and then PC-DMIS 2015.0**.
2. From the list of shortcuts, right-click on either the **Online** or **Offline** icon, and then select the **Run as administrator** option (required only if the **Launch PC-DMIS after the install finishes** check box wasn't checked at the end of the installation).

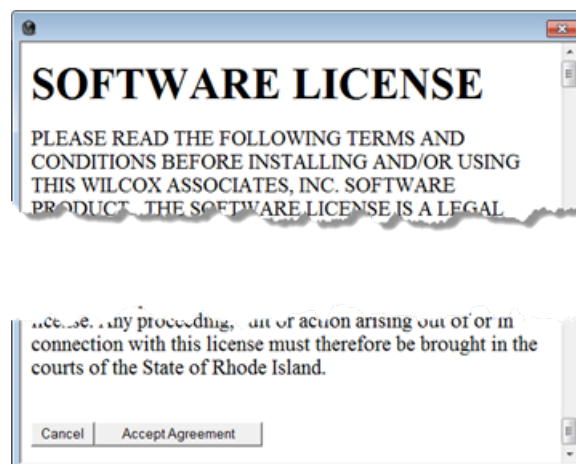

3. This allows the program to write the needed machine-specific settings.
 - If your previous version used the pcdlrm.ini file, PC-DMIS asks if the settings in your PCDLRN.INI file should be used as your registry settings. Click **Yes** at the prompt. Otherwise, PC-DMIS loads in the factory defaults.
 - If your previous version used the Settings Editor, do the following to use your previous PC-DMIS settings:
 - a. Close PC-DMIS.
 - b. Launch the PC-DMIS Settings Editor from the Start menu.
 - c. Once it opens, click **Import**, and open the PCDRRegFile.dat file you backed up in the "[Step 3: Back Up Existing Settings](#)" section of this document. PC-DMIS imports your settings.
 - d. Close the PC-DMIS Settings Editor.

For subsequent startups, you can launch PC-DMIS normally by double-clicking the usual **Offline** or **Online** shortcut.

Once PC-DMIS starts, the **Software License** screen displays the current license agreement. Read the agreement carefully and then at the bottom, click **Accept Agreement** to proceed:

Once PC-DMIS runs, an icon displays in your System Tray. If your portlock or license is programmed correctly, the icon displays a green check mark as shown below. A message says that the PC-DMIS license is valid:

If your portlock is not connected or is not programmed correctly, or if you are using an LMS license and your software has not been properly licensed, the icon appears with a red exclamation point overlay. A pop-up message appears and says that the PC-DMIS license is disconnected:

When the license is disconnected, PC-DMIS functions normally, but after five minutes it automatically closes. Be sure to save your data immediately before this occurs.

Note About CMMs Using RS-232 Communications

By default, PC-DMIS communicates through the COM1 communications port. You need to change this port number to the number that Windows automatically created if a serial-to-USB adapter cable or serial adapter card was installed for communicating with an older RS-232 CMM.

To change the COM port number:

1. In Windows Device Manager, note the number that Windows assigned to the communications port on your computer. For help, refer to Windows Help.
2. Open PC-DMIS in online mode, and then open a measurement routine.
3. Select **Edit | Preferences | Machine Interface Setup**.
4. In the **Comm** port box, enter the port number from Windows Device Manager.

Updating the Software

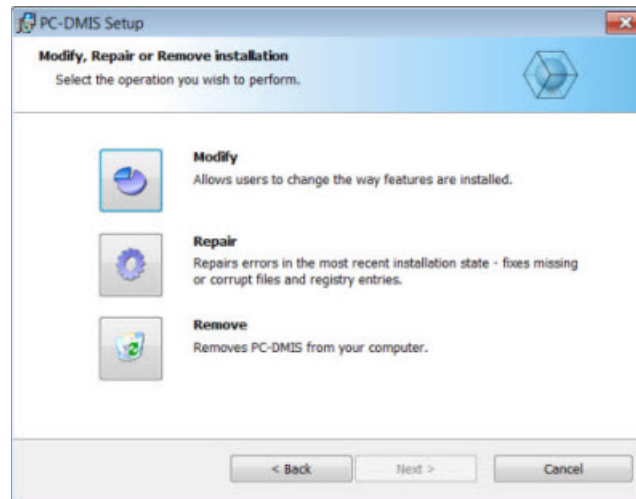

By default, PC-DMIS automatically checks for updates to the software if you are connected to the Internet. If it detects that an update is available, the **Updates** dialog box opens to inform you of the software update. You can then download and install these updates as desired.

You can also manually check for updates by clicking **Help | Check for Updates**.

If you need information on using the software updater, see "Updating the Software" in the PC-DMIS Core documentation.

Modifying, Repairing, or Removing the Installation

You can also modify or repair an installation as needed once it is installed. To do this, double-click on the **Pcdmis2015.0_Release_#.###.#_x##.exe** file as if you were beginning the installation process. The setup displays the **Modify, Repair or Remove** installation screen with these options:

- **Modify** - This option opens the **Custom Setup** screen as discussed in "[Custom Setup](#)". Use this option to change the installed features, either by adding something that was previously not installed or removing a software feature that you no longer need.
- **Repair** - This option reinstalls all of the product files as they were originally installed. This option may help resolve issues where an installation didn't properly install all of the files.
- **Remove** - This option removes the application from where it was installed. You can also uninstall the application using the Programs and Features control panel item in Control Panel.

Running PC-DMIS in Another Language

The initial installation setup file for PC-DMIS contains the user-interface files for all of the supported languages. When you install PC-DMIS, it installs the language files based on your operating system's language.

To run PC-DMIS in a language other than the operating system's language, select **File | Language**, and then click the desired language.

PC-DMIS restarts and displays the application in the desired language. To get the help content available in a non-English language, see the information below.

Installing Non-English Help Files from Language Packs

The English help files are the only help files included in the main installation package. They are installed regardless of the installation language. However, non-English help files are not included in the main installation file.

This means that if you install a non-English language or if you switch to a non-English language, in order to see any help content at all, you *must* also install a language pack for that language. Otherwise, if you try to access the help file, PC-DMIS displays an error message indicating that it cannot find the help file.

A language pack contains all of the help content for that language.

To install a language pack, do the following:

1. Locate the desired language pack (and .exe file) on your installation media or download it from the Internet here:

<ftp://ftp.wilcoxassoc.com/PC-DMIS-Versions/Release/2015.0/Release/Lang>

2. Run the .exe file and follow the setup instructions. You do not need to have administrator access to do this step.

This procedure installs the help content into the appropriate two-letter language subdirectory where you have PC-DMIS installed. You can then switch to that language in the software and access the help content.

Troubleshooting

This topic provides information for you to troubleshoot installation, startup, and software update problems.

PC-DMIS Startup is Slow

Problem: You use a computer with at least the recommended system requirements as detailed in the "[Recommended System Requirements](#)" topic, and it takes longer than 30 seconds to launch PC-DMIS.

Description: This happens if you try to run PC-DMIS on a Windows 7 computer, but you didn't mark **Run as administrator** on the installation wizard. This results in a problem loading the HASP driver. Note that this problem only occurs when you install with a HASP license type as discussed in "[Step 4: Install PC-DMIS](#)".

Solution: Uninstall PC-DMIS, and then reinstall it by right-clicking on the installation file and choosing **Run as administrator**.

Updating the Software Results in a "(407) Proxy Authentication Required" Message

Problem: You use the **Help | Check for Updates** menu option to update the software, and when the Web Updater opens, it shows: "The remote server returned an error: (407) Proxy Authentication Required."

Description: A firewall on your computer may be blocking the updater from connecting to the server.

Solution: Check your firewall's settings and ensure that the following address is not blocked: <http://www.wilcoxassoc.com/WebUpdater>

Setting Up the Network to Send Crash Reports

Problem: PC-DMIS cannot automatically send crash reports to Hexagon Metrology even when the **/nocrashdump** software configuration switch is not being used. (This switch disables crash reports in PC-DMIS.)

Description: A firewall on your computer may be blocking the updater from connecting to the server. If PC-DMIS crashes, it uses a PHP script over HTTP to send the crash report. If this fails, it then tries to send the report to crashreport@wilcoxassoc.com. It tries using the standard SMTP email protocol. If that fails, it tries to send the email through MAPI.

Solution: The crash report system needs to be able to get out to the server, <http://www.wilcoxassoc.com/>, using port 80.

Installing on Top of an Existing Version Results in Unexpected Behavior

Problem: You installed on top of an existing version of PC-DMIS, and now the software does not behave normally. Potential symptoms include:

- After you start up the software, you get a "Procedure Entry Point" error.
- When you select **Help | About**, it does not show the new build number.
- Reported bug fixes do not seem to be fixed, and PCDLRN.EXE does not have a newer date and time than the original release.

Description: Something did not install properly on top of the existing version.

Solution: Use Control Panel to completely uninstall the existing version, and then reinstall the version you're trying to install.

Running the Legacy DPUPDATE.EXE Does Not Work

Problem: The legacy DPUPDATE.EXE does not run.

Description: If PC-DMIS is run without administrator privileges, DPUPDATE.EXE does not work.

Solution: Run PC-DMIS with administrator privileges.

Information about this Release

We at Hexagon Metrology are proud to bring you this new version of PC-DMIS 2015.0. This Enterprise Metrology Solutions platform brings together new aspects of PC-DMIS for the development of a complete manufacturing process control solution. Available in this release are variations of PC-DMIS designed to assist with every aspect of the fabrication and quality control process. The newly created packages include the established PC-DMIS Laser, PC-DMIS NC, PC-DMIS Pro, PC-DMIS CAD, and PC-DMIS CAD++ platforms.

The testing of this version has been significant. We'd like to take a moment to discuss this process and also make you aware of the various components of testing.

Testing is comprised of two parts. These can be described as functional testing and integration testing. The vast majority of testing effort goes on in the functional area. This is the testing that determines that specific functions that are core to the software, regardless of what type of machine is used, are working correctly. The integration testing is essentially a testing of the interface with a particular type of machine.

In the ideal scenario, Hexagon Metrology would have access to at least one of every piece of hardware that is operating in the field running PC-DMIS. However, in practical terms, this is impossible. This integration test plan is then performed on as many types of machines as we have available.

Should you experience problems with your system after you install PC-DMIS 2015.0, it could possibly be an integration problem. If it is a problem of this nature, it will probably be evident immediately upon first use of the possibly untested configuration. See "[Contact Hexagon Metrology](#)" on how to report any integration problems. Should such a problem materialize on a commercial release, you will be given the highest priority for correcting these problems.

For existing users of PC-DMIS who currently have earlier versions of PC-DMIS installed, it is advised that PC-DMIS 2015.0 be installed into a new directory. In this way, you can be assured of continuous use of the existing version should problems arise with this newer version.

New Product Information

2015.0 Release

The 64-bit version of PC-DMIS is only supported on Windows 8.1, Windows 8, Windows 7, and Windows Vista. It is not supported on Windows XP.

For a listing of the enhancements for the 2015.0 Release, refer to "[Release Notes](#)". For detailed information and videos tutorials regarding the enhancements, log on to www.pcdmis.com.

About the PC-DMIS 64-Bit Version

The following items are only supported in the 32-bit (x86) version of the software; they are not available in the 64-bit version.

- CAD (3D ACIS data embedded inside of DXF Files)
- Translators (Aval, Datalog, MeasureMax, MMIV, and Tutor)
- NC product line
- Vision (MEI, Metronics, QVI, ROI, TESAI++, and TESAVISIO). Note that the FDC and Leitz controllers are available in the 64-bit version.
- CMM (B & S Backtalk, Embedded Board, Manmiti, Manmora, Metrocom, Mitutoyo GPIB, GeoCom, GOM, LK, Numerex, Omniman, and anything using the parallel port driver)
- Portable (FaroArmUSB and Axila)

ManualCMM and Tech80 have reduced functionalities.

Note about Calculation of Angle Dimensions

In version 2014, PC-DMIS changed its method of calculating angle dimensions near 0 and 90 degrees. If you load a part program from version 2013 MR1 or earlier into the current version, PC-DMIS displays a Migration Report that lists the angle dimensions that have been unmarked for execution and should be checked.

For nominal angles within 10 degrees of a quadrant boundary (0, 90, 180, 270, 360, -90, or -180 degrees), the positive/negative sign of the measured angle is enforced. This prevents a measured angle of -1 degrees from being reported as +1 degrees to match the same quadrant as a nominal angle of 2 degrees. This also prevents a measured angle of 92 degrees from being reported as 88 degrees to match the same quadrant as a nominal angle of 89 degrees. To turn off this behavior, set the value for the **EnforcePositiveNegativeAngles** registry entry in the Settings Editor application to False.

To change the sign of a nominal angle near 0 degrees or choose the supplemental angle of a nominal angle near 90 degrees:

1. Flip the direction vector of one of the features.
2. Create a line that represents the X, Y, or Z axis.
3. Reverse the sequence of feature 1 and feature 2.
4. Or, perform a combination of the above steps.

Running the PC-DMIS Universal Jogbox Utility

If you are using the PC-DMIS Universal Jogbox Utility (PCD_UJB_Util.exe *32), ensure that you do the following:

- Start the utility as XP-SP2 compatible:
 1. Right-click on the **PC-DMIS Universal Jogbox Utility** icon on your desktop, and then select **Properties**.
 2. Select the **Compatibility** tab.
 3. Select the **Run this program in compatibility mode for** check box, and then select **Windows XP (Service Pack 2)** in the list.
 4. Select **Apply** and then **OK**.
- After the utility has been installed, do not run it as an administrator.
- Run the utility with the logon account properties that are set for the current user.

Release Notes

Version 2015.0 is a significant development release of the software.

Featured Items

Execution Time Options and Functions

General Setup Options

The following options in the **Execution** area on the **General** tab in the **Setup Options** dialog box (**Edit | Preferences | Setup**) display the remaining execution time for a measurement routine or mini routine:

- **Record and display execution time** check box - If you select this check box, PC-DMIS displays the remaining execution time (in <hours>:<minutes>:<seconds>) for a measurement routine or mini routine for the new **Time Remaining** item in the **Execution** dialog box (**File | Execute** or **File | Partial Execution**). Note that:
 - PC-DMIS records the remaining time for only the DCC portion of a measurement routine.
 - PC-DMIS stops recording the remaining time when the measurement routine or mini routine pauses due to attention required by the user. For example, the execution may pause when a comment is executed, a message appears, or an error appears and the execution stops.
 - PC-DMIS does not record the remaining time if the execution does not get completed or if you suspend it.
- **Add to execution time (seconds)** check box - If you select the check box, PC-DMIS adds the number of seconds that you enter (in the related box) to the measurement routine or mini routine execution time when the execution finishes. You may want to use this option if the time required to complete a measurement routine includes other actions in addition to executing the measurement routine or mini routine (such as printing the measurement results).

For more information about these setup options, refer to "Execution Area" and "Using the Execution Dialog Box" in the PC-DMIS Core documentation.

Execution Time Options in Mini Routines Dialog Box

The following options are available on the shortcut menu in the **Mini Routines** dialog box (**File | Partial Execution | Mini Routines**):

- **Show Execution Time** - This option displays the execution time in <hours>:<minutes>:<seconds> to the right of the **Entire Routine** option, the mini routine name, and the sub mini routine name in the rightmost pane of the **Mini Routines** dialog box.
- **Update Execution Time** - This option updates the execution time after every execution. This update function is available for the entire routine as well as for each separate mini routine. It is selected by default.

For more information, refer to "Mini Routines" in the PC-DMIS Core documentation.

String Functions

These string functions are available:

- ELAPSEDEXECUTIONTIME() - This function returns the time that has elapsed since the measurement routine or mini routine started to execute.
- LASTEXECUTIONTIME() - This function returns the last execution time that PC-DMIS recorded and stored in the *<name of measurement routine>.MiniRoutines.xml* file.

For more information, refer to "String Functions" in the PC-DMIS Core documentation.

Gage Scan Calibration Strategy

The Gage Scan Calibration strategy helps you measure the form of a circular feature with the highest possible accuracy. The technical specification for the scanning capability of a CMM defines the terms and concepts that are related to the roundness of individual and integral features. The gage scan filter corrects the measured scan data by comparing it to similar scan data from a gage.

The Gage Scan Calibration strategy calibrates a tip to determine the parameters for the gage scan filter. The strategy scans the inside or outside circle (usually on a ring or plug gage) and determines the filter parameters. These parameters are stored in the probe file (.prb). The calibration results are recorded in the probe's results file (.Results). The **Gage Scan Filter** box in the **Edit Probe Data** dialog box (**Insert | Hardware Definition | Probe | Edit** button) shows the availability of gage scan data. For more information about this box, refer to "Gage Scan Filter" in the PC-DMIS Core documentation.

Two methods are available for determining the gage scan filter parameters:

- Software compensation (for all types of controllers)
- Hardware compensation (for B5 and higher Leitz controllers)

These methods are located on the **General** tab in the Probe Toolbox in the **Auto Feature** dialog box (**Insert | Feature | Auto**). For more information, see "Setup Tab - Gage Scan Calibration Strategy" in the PC-DMIS CMM documentation.

The Gage Scan Calibration strategy involves the following steps:

1. Place a ring gage with a diameter that is similar to the diameter on the part with the same orientation close to the position on the machine where the part will be measured.
2. Align this ring gage based on the top surface and the circle.
3. Perform the gage scan calibration after the alignment is complete.
4. After the calibration is complete, use the Adaptive Circle Scan or Adaptive Cylinder Concentric Circle Scan strategy to measure a circle or cylinder.

- To filter the measured data and calculate the form that is using the data, select the **Use Gage Scan Filter** check box on the **Filters** tab in the Probe Toolbox. For more information, see "Enabling the Gage Scan Filter" in the PC-DMIS CMM documentation.

The "Gage Scan Calibration Strategy" topic in the PC-DMIS CMM documentation provides complete information about the strategy, plus an example.

I++ Server Accepts Zeiss A and B Angles Convention

The I++ Server accepts A and B angles, which are reported using Zeiss conventions. This enhancement enables you to use the same program for Zeiss or DEA machines on your client software. It is also compatible with chorus programs.

For complete information about I++ Server, refer to the "PC-DMIS I++ DME Server Setup Guide".

Part Temperature Compensation for Romer Absolute Arm

Part temperature compensation is available for the Romer absolute arm. This feature provides the ability to monitor the part temperature during inspection; it also increases the accuracy of the inspection process. Note that part temperature compensation requires an external temperature sensor.

To enable part temperature compensation, select **Insert | Parameter Change | Temperature Compensation**. This option inserts the Temperature Compensation command into the measurement routine.

Extended Sheet Metal Options for Auto Features

Extended sheet metal options are available for all contact and laser auto features (except for Corner Point). You can use these options to measure against inspection plans.

To access extended sheet metal options, select the **Show Extended Sheet Metal Options** check box on the **General** tab in the **Setup Options** dialog box (**Edit | Preferences | Setup**), and then do the following:

- Select **Insert | Feature | Auto** and choose an auto feature that supports extended sheet metal options.
- Select the **>>** button in the **Auto Feature** dialog box for **Show Extended Sheet Metal Options**. This button appears only for supported features.
- Complete the available options in the **Extended sheet metal options** area in the **Auto Feature** dialog box.

For more information, refer to "Extended Sheet Metal Options Area" in the PC-DMIS Core documentation.

Enhanced Laser Data Filter Settings

In PC-DMIS Laser, data filtering allows real-time filtering of the data; the data is removed while scanning. To support this change, the filtering options in the **Data Filtering** area in the **Laser Data Collection Settings** dialog box (**Operation | Pointcloud | Data Collection**) were enhanced as follows:

- The **Line Filter** check box was added. If you select this check box, PC-DMIS sets a real-time filter for individual lines; the filter typically removes scan line noise and results in smoother data. This option also enables you to enter values for the maximum standard deviation and hole length.
- The **Percent Reduction** option was changed to a check box. If you select this check box, PC-DMIS removes a percentage of the pointcloud data that is collected.
- The **Distance Density** option was changed to a check box. This real-time filter provides a filter based on the point distance value that you enter.

For more information about filtering, refer to "Laser Data Collection Settings" in the PC-DMIS Laser documentation.

Improved Mesh Display Quality and Speed

If you select the **Mesh** option in the **Laser Data Collection Settings** dialog box in PC-DMIS Laser, laser data appears as a mesh during scanning. The current scan pass displays as a pointcloud, and previous passes display as a mesh. The Mesh display is relative to the orientation of the laser sensor.

While scanning, if the laser sensor orientation changes more than 25 degrees in a single scan pass, PC-DMIS meshes collected data and automatically creates a new patch scan. You can define the displayed mesh by the **Grid Size** and **Max Triangle Size** values. After scanning, the data remains displayed as a mesh. When you close and then reopen the PC-DMIS measurement routine, this data appears as a pointcloud.

Mesh display functionality requires the Mesh license. For licensing information, contact your Hexagon Metrology representative.

For more information about mesh functionality, refer to "Laser Data Collection Settings" in the PC-DMIS Laser documentation.

The **Mesh** option is available only with an LMS license. It also requires the "Big COP" (cloud of points) license option to be enabled.

"Big COP" License Option

The Big COP license option is included for PC-DMIS Laser (but does not include Vision probes). This option provides full pointcloud functionality. The previous COP option (Small COP) limits the number of points in a COP to 500,000. COP is included with PC-DMIS CAD++.

If the Small COP limit is exceeded, the following message appears: "Maximum pointcloud size exceeded, pointcloud will be reduced. Contact your Hexagon Metrology representative to upgrade your license for unlimited pointcloud size."

For more information about Big COP and Small COP, including differences in functionality between the two license options, see "Using Pointclouds" in the PC-DMIS Laser documentation. For license information, contact your Hexagon Metrology representative.

2D Meshing Management

For a 2D mesh display while scanning in PC-DMIS Laser, when the scanner orientation changes to go around a curved surface (such as a cylinder), PC-DMIS meshes the "patch" in one direction and starts a new patch for the changed direction.

For details about meshing, refer to "Laser Data Collection Settings" in the PC-DMIS Laser documentation.

2D View of Cross Section

When you define a cross section in PC-DMIS Laser, you can display an individual section in a 2D view in the Graphic Display window. This view is normal to the cross section. Any annotation points that are created on the cross section appear in the 2D view.

For complete information, refer to "2D View of Cross Section" in the PC-DMIS Laser documentation.

Simulating Points in a COP in Offline Mode

The new Simulate Pointcloud function enables you to create and view a pointcloud from the **Scan** dialog box (**Insert | Scan |** selected scan method) when the CMM is in offline mode. With this feature, you can review the simulated pointcloud and make changes for an individual scan. A COP holds the simulated points.

You can execute the entire measurement routine offline after you create the scans. This displays all of the scans in different probe orientations; it also enables you to check, for example, if you can extract scanned auto features based on the scan settings.

The supported scan methods are:

- Linear Open
- Patch
- Perimeter
- Freeform

For details, including an example of using the Simulate Pointcloud function, refer to "Using the Simulate Pointcloud Function" in the PC-DMIS Laser documentation.

Target Mode for Large Auto Features in PC-DMIS Vision

In PC-DMIS Vision, the new Target mode for the Line auto feature locates and measures large auto features in the CAD View and the Live View. When you program with the Live View, this measurement strategy provides measure-as-you-go functionality.

To begin using Target mode for a large auto feature, from the **Auto Feature** dialog box (**Insert | Feature | Auto | Line**), in the Probe Toolbox, on the **Hit Target** tab, click the **Large Feature Mode** icon. The icon is available only for the **Automatic Hit Target** type.

For more information about this mode, plus examples that show how to use it in the CAD View and the Live View, refer to "Large Feature Measurement Mode" in the PC-DMIS Vision documentation.

Auto Features

- PCD-58987 - Added the **DisplayProbePositionAsLastMove** registry entry to the Settings Editor application. This registry entry affects the display of the probe position when you create auto features. If you set the entry to True (the default), the software shows the probe at the last move of the feature path execution. If you set it to False, the software shows the probe at the center of the auto feature (target value).
- PCD-58986 - Changed the method for distributing the sample hit pattern for round and square contact slots when you select the **Sample Hits** option on the **Contact Sample Hits Properties** tab in the **Auto Feature** dialog box (**Insert | Feature | Auto | Round Slot** or **Square Slot**). PC-DMIS now spaces two of the hits along the same line along the edge of the slot the full length of the slot.
- PCD-65403 - Improved the Quick Features functionality to update the **Auto Feature** dialog box with data from the CAD model in the Graphic Display window based on the mode (Creation mode or Edit mode).
- Added "snap to grid" support to the Quick Features functionality for these auto features:
 - PCD-54669 - Vector points
 - PCD-54670 - Laser edge point
 - PCD-67390 - Laser surface point
- PCD-63817 - Enabled report vectors, laser/contact auto features, and laser/contact quick features to automatically update with the feature that you select from the CAD model. This change reduces the time you need to create auto features that report the RT axis on the dimension.

CAD

- PCD-56858 - Added functionality that enables you to fix all CAD surface vectors when you import an IGES file:
 - Enabled the **Fix Surface Vectors** button in the **CAD Vectors** dialog box (**Edit | Graphic Display Window | CAD Vectors**). Previously, this button was disabled until surfaces were selected. To fix the surface vectors of the entire CAD model, select this button without selecting surfaces. If you select surfaces, then the software fixes only those surface vectors (this is the previous behavior).
 - Added the **Fix surface vectors** check box to the **IGES File** dialog box (**File | Import | IGES | selected IGES file**). To fix CAD surface vectors after you import an IGES file, select this check box.
 - Added the **FixSurfaceVectors** registry entry to the Settings Editor application. This registry entry specifies if the **Fix surface vectors** check box in the **IGES File** dialog box is selected (the default) or cleared.
- PCD-60015 - Implemented ProE GD&T selection for Direct CAD Interfaces (DCI).

- PCD-60224 - Added the **Use nothing** option to the **Edit Rule** dialog box for the Rule Tree Editor. If you select this option, PC-DMIS does not display any report information for the item that you defined as a condition. You may find this option useful if you do not want to display anything for a specific feature, command, or condition.

To access the **Use nothing** option:

1. Select **File | Reporting | New | Report Template**.
 2. Select the **TextReportObject** object, and insert it into your report template.
 3. Right-click on the object, and then click on **Rules** next to the **RuleTree** property.
 4. In the **Rule Tree Editor** dialog box, add or edit a rule. The **Edit Rule** dialog box appears. Note that this dialog box contains the **Use nothing** control so that you can specifically prohibit information (even default information) from displaying for that rule.
- PCD-56062 - Import hidden construction and geometry elements for the CATIA v6 translator. Previously, hidden elements were not imported.
 - PCD-64328 - Add gesturing so that multiple arc segments can create an arc or circle using Quick Features.
 - PCD-67314, PCD-66629 - Colored the vectors in the Graphic Display window, and the labels associated with them, in the **Auto Feature** dialog box (**Insert | Feature | Auto**). This provides a color-centric way to identify each vector.

For auto features, the vector colors are:

- Blue - Surface
- Green - Edge
- Orange - End angle
- Purple - Start angle
- Red - Angle and line

For Quick Features, the vector colors are:

- Light blue - Surface
 - Light green - Edge
 - Light red - Angle and line
- PCD-66630 - Standardized the vector size for auto features. If the **Pt. Size** value in the **Analysis** area in the **Auto Feature** dialog box is set to 0 (zero), the vectors are a fixed value and do not auto-scale.
 - PCD-67897 - Added the **File | Export | Part Model | CAD Mesh** menu option so that you can export a CAD model as a lightweight mesh (as a.cad or .draw file). The export process saves the model's surfaces as triangle meshes instead of mathematical surface definitions.

Execution

- PCD-61765, PCD-61763 - Added options and functions that display the execution time for a measurement routine or mini routine. For details, see "[Featured Items](#)".
- PCD-45885 - Added the ability to select features in the Graphic Display window for execution in a mini routine or sub mini routine.

I++ Server

- PCD-61460 - Enabled the I++ Server to accept the A and B angles convention as used by Zeiss/Chorus. For details, see "Featured Items".
- PCD-70017 - The last tool used is active at session opening. The I++ Server keeps the last tool used active by default (either by PC-DMIS or by another I++ session), when a StartSession() is performed.

However, if the `startWithUnknownTool` registry entry is set to True, Tool.Name() is reported as "UnknownTool" (as it has been until v3.18 of the I++ Server). The Server version is reported using the command BS_GetVersion().

Laser / Cloud of Points

- PCD-63461 - Modified the options in the **Data Filtering** area in the **Laser Data Collection Settings** dialog box. For details, see "[Featured Items](#)".
- PCD-63466 - Improved mesh display quality and speed. For details, see "[Featured Items](#)".
- PCD-63553 - Meshed the "patch" in one direction and created a new patch for a different direction for a 2D mesh display while scanning. For details, see "[Featured Items](#)".
- PCD-62479 - Added the ability to display an individual section from a cross section in a 2D view. For details, see "[Featured Items](#)".
- PCD-64115, PCD-64141, PCD-64194, PCD-64104, PCD-62304, PCD-63766, PCD-63654, PCD-63876, PCD-64525 - Added extended sheet metal options to PC-DMIS Laser auto features. For details, see "[Featured Items](#)".
- PCD-60006 - Added the ability to create simulated points for offline scan commands. For details, see "[Featured Items](#)".
- PCD-37978 - Modified the system startup process for PC-DMIS Laser as follows:
 - If PC-DMIS is configured for the HP-L-20.8 laser sensor at startup, the system identifies the currently mounted probe.
 - If the currently mounted probe is not the HP-L-20.8 laser sensor, and a probe changer is present, the system assumes that the sensor is in the probe changer and switches on the warm-up power state. This helps to ensure that the sensor is warmed and ready for measuring.

Licensing

- PCD-70527 - Implemented the ability to automatically toggle from the HASP to the LMS license platform. If you keep your current version of PC-DMIS, this update allows you to change your current license from HASP to LMS. For complete details, see the topic "Client License Manager Software" in the CLM license documentation found in the appropriate language folder of your PC-DMIS installation.

Machine Interface

- PCD-33339 - Added support for the Tech80 and manual CMM interfaces to the 64-bit version of PC-DMIS.

For information about operating and configuring the manual CMM interface, refer to the "Manual CMM Interface" document located at:

ftp://files.wilcoxassoc.com/Hardware/CMM/ManualCMM/MANUAL_CMM.pdf

The Tech80 interface is restricted to the Brown & Sharpe CSI USB interface box for a manual CMM. Hardware, interrupt, and OldCaliperDLL settings are not available in the 64-bit version.

Model Based Definition

- PCD-59332 - Removed, from the Inspection Plan Default (.ipd) file, parameters that do not apply to Vision features. Added parameters that do apply.

Planner

- PCD-39475 - Redesigned Planner so that it uses the latest PC-DMIS technologies. Planner is an independent application that works with PC-DMIS and a CAD software package. Design engineers and quality engineers can use Planner to design an inspection plan that specifies the geometry and GD&T/dimension features to use in the inspection process. They can then import the plan into PC-DMIS, which automatically determines how to efficiently measure it.

For licensing information, contact your Hexagon Metrology representative.

Pointclouds

- PCD-41514 - Added the Big COP license option, which provides full pointcloud functionality. For details, see "[Featured Items](#)".

Portable

- PCD-70731 - Added the **Auto End** check box to the **Quick Start** interface (**View | Other Windows | Quick Start**). If you select the **Auto End** check box, PC-DMIS automatically finishes or ends a feature in Learn mode after it takes the defined number of hits needed to measure the feature. (You do not need to press any buttons or keys.) You can enter the defined number of hits for each feature type by pressing the Up and Down arrow keys.

Probes

- PCD-65952 - Added the HH-A probe head.
- PCD-63706 - Please note that some probe types (such as the SP25) do not support Fast Probe mode (**Insert | Parameter Change | Probe | Fast Probe Mode**). Some machines do not support Fast Probe mode regardless of the probe type. If you have a measurement routine with the FASTPROBEMODE/ON command in it, but your probe type or machine does not support it, the command will not do anything.

Reporting

- PCD-50342 - Added the **Configure | Dimension Format** menu option to the Excel Template Editor (**File | Reporting | New | Excel Template**). When you open the editor and then select this option, the **Properties** dialog box appears. You can use the tabs in this dialog box to select the items to add to an Excel template and their order.
- PCD-53709 - Added the ability to open multiple Excel Viewers at one time when editing a template (**File | Reporting | Edit | Excel Template**) or viewing an Inspection Report (**View | Inspection Report**).
- PCD-50334 - Enabled the ability to drag and drop individual items for commands onto an Excel template.

Temperature Compensation

- PCD-41375 - Added part temperature compensation to the Romer absolute arm. For details, see "[Featured Items](#)".

Toolkit

- PCD-32082 - Added the Gage Scan Calibration strategy, which helps you measure the form of a circular feature with the highest possible accuracy. For details, see "Featured Items".
- PCD-38065, PCD-53124 - Added options and functions that display the execution time for a measurement routine or mini routine. For details, see "[Featured Items](#)".
- PCD-42519 - Changed the Blade Nominals Editor command to use low-point density instead of high-point density for partial blade ends.

PC-DMIS 2015.0 Release Notes

- PCD-61184 - Added the ability to use the Blade COP Section command to section full sections, partial sections, square sections, and skew sections.
- PCD-65448 - Replaced the Freeform Plane toolkit module with the Adaptive Free Form Plane Scan strategy. If you open a measurement routine that contains a Freeform Plane toolkit feature, PC-DMIS automatically converts the feature to the Adaptive Free Form Plane Scan strategy.

User Interface

- PCD-56240 - Changed the name of the **Open** dialog box for importing a CAD file (**File | Import | CAD**) to **Import**.
- PCD-57848 - Added the BRAVO HP 180.16.25-4 and BRAVO HP 60.16.30-2 virtual machines to the machine.dat file.

Vision

- PCD-35657 - Added the ability to target and measure large auto features in the CAD View and the Live View. For details, see "[Featured Items](#)".

Contact Hexagon Metrology

If you are participating in the *technical preview* of PC-DMIS 2015.0, please post your feedback in the appropriate technical preview forum located at <http://www.pcdmisforum.com/forum.php>. Please do not contact Technical Support for technical previews.

If you are using the *commercially released version* of PC-DMIS 2015.0 and would like further information or technical support, please feel free to contact <http://hexagonmetrology.us/contact-us> or visit www.pcdmis.com. You can also reach Hexagon Metrology Technical Support by calling (1) (800) 343-7933.

Appendix A

Providing LMS Licensing Information to the Installer from the Command Line

You can send LMS licensing information to the installer by using the command line:

- If the installer is running in silent mode (**/q**) or basic silent mode (**/qb**), and the correct information is provided, everything runs without user interaction. The command switch **/qb** displays the progress bar and handles installer errors, while the **/q** switch hides the user interface.
- If the installer is not running in silent mode, the information provided is used to populate the LMS activation form and skip the [Choose License Type screen](#).

A description of the parameters follows, along with examples:

USELMSLICENSING="1" - This flag is useful only if the system already has an LMS license that the user is using. It allows silent mode to work without having to prompt the user for a license choice. If the installer is not running in silent mode, it still allows the install process to skip the license type selection dialog (thus saving some time).

ENTITLEMENTID="<entitlement id>" - This parameter and value are useful on a new system where no LMS license was previously installed. It indicates that the user wants LMS licensing and provides an Entitlement ID to try and activate. When this value is specified, there is no need to specify **USELMSLICENSING**.

LMSLICENSESERVERS="<server1>,<server2>..." - This parameter is used on systems that speak with a license server. It also allows the license type selection dialog box to be skipped and the installation to be done silently.

LMSPROXYHOST="<proxyhostaddress>" - This optional parameter gives the address of a proxy host. In silent mode, it is used directly in activation. In non-silent mode, it populates the activation form with this value.

LMSPROXYUSERNAME="<username>" - This parameter is another optional parameter for the proxy user name. It behaves in the same manner as **LMSPROXYHOST**.

LMSPROXYPASSWORD="<unencrypted password>" - This parameter is another optional parameter for the proxy password. It behaves in the same manner as **LMSPROXYHOST**.

LMSFNOURL="<URL to FNO server>" - This parameter is mostly for internal development. The default URL is to the production server. The new value can be used to override the default value and point to the development server.

On a brand-new system with a node locked Entitlement ID, the following line installs PC-DMIS in silent mode:

```
/qb ENTITLEMENTID="99999-88888-77777-66666-55555"
```

On a system that already has a license, the following installs PC-DMIS in silent mode:

```
/qb USELMSLICENSING
```

On a brand-new system using license servers, the following installs PC-DMIS in silent mode:

/qb LMSLICENSESERVERS="123.12.134.42"

On a brand-new system with no license, the following skips the license type selection dialog box and populates the activation form:

ENTITLEMENTID="99999-88888-77777-66666-55555"

LMSPROXYHOST="123.123.123.123" LMSPROXYUSERNAME="bob"

LMSPROXYPASSWORD="marley"

Appendix B

Understanding File Locations

The default file locations (path locations) for various user-specific settings and other files have changed in PC-DMIS 2010 MR2 and later to comply with newer operating system standards. Previously, much of this information was stored inside of the install directory of PC-DMIS.

These files are now stored in the following locations for Windows Vista, 7, and 8, based on each file's role (where <version> is the PC-DMIS version).

Public Documents

Measurement routine, CAD, probe, and other files:

C:\Users\Public\Public Documents\WAI\PC-DMIS\<version>

Demo CAD files:

C:\Users\Public\Public Documents\WAI\PC-DMIS\<version>\CAD

Public Documents (Reporting Directory)

Report template, label template, rule definition, and color definition files:

C:\Users\Public\Public Documents\WAI\PC-DMIS\<version>\Reporting

Public Documents (Fixturing)

Fixturing files:

C:\Users\Public\Public Documents\WAI\PC-DMIS\<version>\FIVEUNIQUE

Program Data Files [Hidden]

Calibration files (such as comp.dat and compens.dat), setup files (such as tool.dat, toolc.dat, and usprobe.dat), and other files:

C:\ProgramData\WAI\PC-DMIS\<version>

User Data Files

Files for toolbar and menu layout, lighting and materials, and settings:

C:\Users\<username>\AppData\Local\WAI\PC-DMIS\<version>

Where <username> is your window's logon user name.

Also see "Understanding the .DAT Files" in the PC-DMIS Core documentation for more specific information on data files.

Note: In addition, functionality was added to the Settings Editor that allows you to back up, restore, or clear user-specific files and settings. Rather than manually deleting or restoring individual files on your own, we recommend that you use the tools provided in the Settings Editor instead. For more information, refer to the Settings Editor documentation.

Required User Access Rights

PC-DMIS requires read, write, and create access to the locations defined below in the file system and registry.

File System

Windows XP

- **C:\Documents and Settings\All Users\Application Data\WAI\PC-DMIS\2015.0**
- **C:\Documents and Settings\All Users\Documents\WAI\PC-DMIS\2015.0**
- **C:\Documents and Settings\User Name\Local Settings\Application Data\WAI\PC-DMIS\2015.0**
- Any user-specified folder locations for storing measurement routines, probes, subroutines, and so on

Windows Vista, 7, and 8

- **C:\ProgramData\WAI\PC-DMIS\2015.0**
- **C:\Users\Public\Documents\WAI\PC-DMIS\2015.0**
- **C:\Users\User Name\AppData\Local\WAI\PC-DMIS\2015.0**
- Any user-specified folder locations for storing measurement routines, probes, subroutines, and so on

Registry

All of these versions have their own registry settings, which are stored in a version-specific Key. The items shown below are for version 2015.0.

x86 OS

- HKEY_LOCAL_MACHINE\SOFTWARE\WAI\PC-DMIS\2015.0 Key and all sub keys
- HKEY_CURRENT_USER\Software\WAI\PC-DMIS\2015.0 and all sub keys
- HKEY_USERS\DEFAULT\Software\WAI\PC-DMIS\2015.0 and all sub keys

x64 OS

- HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\WAI\PC-DMIS\2015.0 Key and all sub keys
- HKEY_CURRENT_USER\Software\WAI\PC-DMIS\2015.0 and all sub keys
- HKEY_USERS\DEFAULT\Software\WAI\PC-DMIS\2015.0 and all sub keys

Notes

- The first time you run a new version, PC-DMIS automatically copies the settings from the most recent version of PC-DMIS that is installed. For this to work, PC-DMIS needs to run with administrator privileges the first time you run it. During the installation, if you select the **Launch PC-DMIS after the install finishes.** check box in the setup wizard, it runs PC-DMIS as an administrator and completes this first step.

This initial migration automatically sets read, write, and create permissions on the registry for the relevant Keys.

- If you are using fixturing or laser sensors, the following registry keys are stored back one level:
 - HKEY_LOCAL_MACHINE\SOFTWARE\WAI\FxtServer
 - HKEY_LOCAL_MACHINE\SOFTWARE\WAI\PC-DMIS\NCSSENSORSETTINGS
 - It may be easier to just apply create/read/write privileges to the HKEY_LOCAL_MACHINE\SOFTWARE\WAI\ key and all sub keys to cover these also.

Appendix C

First-Time PC-DMIS Installation with Flexible Fixturing

To be compliant with the permission rules for PC-DMIS products, files associated with fixturing are now located in this folder:

C:\Users\Public\Documents\WAI\PC-DMIS\FIVEUNIQUE

This allows access to the files without needing administrator privileges on the computer running PC-DMIS.

To accomplish this, the following steps are required when you install PC-DMIS for the first time:

1. The first time you install PC-DMIS and FxtServerInterface, run the FxtServerInterface installation program for the first time with administrator privileges (as is required for the PC-DMIS install).
2. When running FxtServerInterface, a message states that the system will migrate all your data files to the "FIVEUNIQUE" Documents folder described above.
 - If you choose "Yes", the files are moved, and the original folder is deleted.
 - If you choose "No", the files are copied, but the original folder is kept.

Once this is done, the files are moved (or copied), and you are able to run FxtServerInterface.exe without administrator privileges.
